

STEAG Technischer Service GmbH

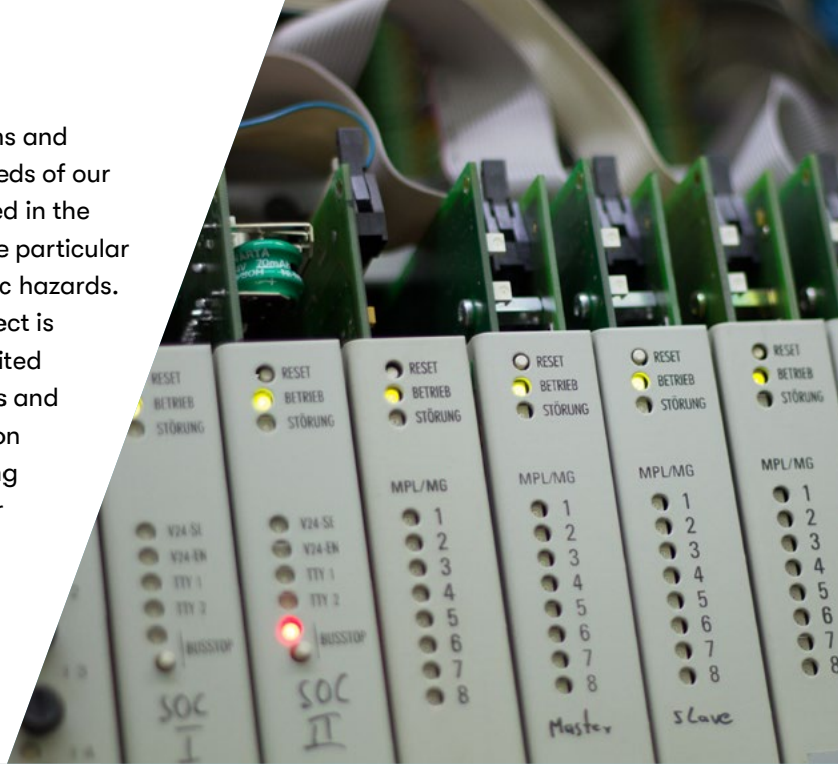

Security Systems

The Security Systems department of STEAG Technischer Service plans, supplies, installs and services security systems and their components for power generating plants and industrial plants, and for office and commercial facilities. Our range of services in detail:

- Consulting and planning services for, installation, modification and optimization of security systems in new-built projects and in projects relating to expansion, modification or change in use of facilities
- Development of technical concepts on the basis of requirements defined by the customer and/or by authorities
- Support to plant operators in consultations with authorities, obtaining of expert reports, and project management support
- Overall implementation of systems, including supply, installation and maintenance

Fire alarm systems

One focus of our services is on early fire detection systems and equipment. We install such systems customized to the needs of our clients, duly considering all official requirements stipulated in the building permit and in the fire protection concept, and the particular customer's individual security needs and business-specific hazards. Last but not least, our specialists make sure that the project is implemented within the agreed budget. Using the best suited sensor technology – ranging from conventional IR sensors and gas sensor systems, hot spot sensors and smoke aspiration systems to complete and detailed area and line monitoring by means of optical fiber systems – we help to make your facility more secure. Specifically for fire and temperature monitoring on conveyor belt rollers, we have developed our own, patented "Conveysafe" technology.

Certificates

- DIN 14675 (covering planning, installation and maintenance of fire alarm systems)
- QM certificate to DIN EN ISO 9001: 2015
- Occupational health and safety certificate to DIN ISO 45001: 2018

Capitalizing on decades of experience in the servicing of STEAG's own facilities, we also provide services in the following areas:

- Intrusion detection systems
- Access control systems
- Public address and alarming systems
- Closed-circuit television (CCTV) systems for process monitoring and site security
